Finding out about Windows themes is often a bit of a chore. Those of you who are interested in themes might find it worthwhile to read this guide. Creating a Windows theme that suits your expectations is an interesting job. The creation of a unique theme for all PCs should be the first thing on your agenda. Where else can you find a free, simple and

quick way to get the job done?
Finding out about Windows
Themes might be just what you
need. Benefits of Windows
Themes A Windows theme is a bit
of software that combines the
background image of a PC with an
assortment of gadgets and options.
It can be set so that it can be left
to run all the time or just for a
certain time. You can even
configure the theme according to a
timeline, such as launching a clock
widget at a specific time of the
day. Consequently, when used

right, a Windows theme can greatly enhance the look and feel of the PC. Some of the gadgets you find on a Windows theme include gadgets for the start screen, home screen, task bar, clock, and weather. You can also configure the theme so that it can be different according to the Windows version you use. For instance, a Windows 95 theme will look different than one for Windows 98. Consider the following tips before you get started: 1. Don't use too many

gadgets: The appearance of a Windows theme is the result of the work of many components. If you set too many gadgets, the theme will look cluttered. In some cases, you may not be able to tell one gadget from another.

2. Choose the right gadgets: Some gadgets that are suggested for a Windows theme are the wallpaper, start screen, clock, weather, calendar, and taskbar. You can use any gadget you wish, but with the exception of the wallpaper, you need to be sure that the gadget you

choose is compatible with the theme you use. 3

Consoles Billing SoftwareQ: Why

is there a negative correlation
between the slope of a rise and the
duration of its peak? I have been
experimenting with the code in
this answer, and I've noticed
something interesting. When I

switch the sign of the function, so that it increases instead of decreases, I notice that the negative correlation disappears. Why does this occur? A: This is a bit of an observation, but I think the simplest explanation is that your peak in the rising function is not a perfect equilibrium point. Consider that the average rate of change of a function is 0 and the number of periods from the first to the last point is -2 . Now, imagine that your peak is only at $t=0$, and your function were to

rise at the maximum possible rate, i.e. it doubles with each unit of time, then the total number of periods since $t=0$ to the peak would be $\frac{2}{0} = \infty$. However, if your function were to double in 2 time-units, then the total number of periods would be $\frac{2}{1} + \frac{2}{2} = 5$. So, what we see here is that a perfect rising peak can be countered by the fact that it actually increases. In other words, if your function is rising in something like $f(t) = 4t$ for

$t > 0$, it will be constantly rising until $t = 1$, when the curve will start falling. Conversely, if your function is falling with something like $f(t) = -t$ then a period from 0 to 1 would be completely counterbalanced by a period from -1 to 0 , and there will be no change in the overall sign of the curve. A: When the slope of a rising function is positive, it has the tendency to increase its height and the curve asymptotically tends to the horizontal axis, which leads to a limiting value for the

function. On the other hand, when the slope of a falling function is negative, it has the tendency to decrease its height and the curve asymptotically tends to
